

Method and System for Multicasting Call Notifications

ABSTRACT

5 A method for communication over a network, which can be both analog and
digital includes simultaneously transmitting a call notification to a plurality of
communication devices. These communication devices include devices such as
telephones, pagers, computers, and voice mail systems. The addresses (e.g.,
telephone numbers) are stored in a database which is queried based on the call
10 notification. For example, this method can be used in a find-me/follow-me system or
to initiate a conference call.
